Production facilities

Concrete roof waterproofing with HYPERDESMO system,
NORM cement factory, Azerbaijan

Waterproofing in production facilities like factories is critical for protecting the building structure, equipment, and products from water damage. It involves applying specialized materials and techniques to roofs and floors to prevent water infiltration.

Roof Waterproofing: Protects the building from leaks, ensuring a dry and safe working environment. It also helps prevent damage to equipment, materials, and products stored within the facility.

Floor Waterproofing: Prevents water from seeping into the concrete slab, which can lead to structural damage, mold growth, and equipment malfunction. It is particularly important in areas with high moisture levels, such as food processing plants and chemical factories.
